Goal inference with a historical answer-conditioned scorer

1 Observed task sequence

Jessica inspects kitchen appliances;
the question supplies a belief premise
and asks which object she is seeking.

2 Actual intermediate code

The neural social code favors salmon.

Historical query evidence and Bayesian
fusion change the final answer toward
apple.

3 Saved prediction

Direct: A (wrong).

SSC final: B (correct).

The successful endpoint cannot be
attributed to the neural code alone.

Post-hoc historical example. Query/options, deterministic rules and answer-conditioned scoring are part of this protocol.
